

Hackathon Challenge Study Notes - AI Career Memory Assistant

What the Judges Want

Help users think clearly, understand tradeoffs, make decisions, and take action.

Reasoning > Generation

A system that analyzes, compares, and recommends is stronger than one that only generates text.

Decision Moment

The user should be able to decide whether to apply now, learn missing skills, build another project, or choose another path.

Uncertainty to Action

Move users from confusion to understanding, then decision, then action.

Show Uncertainty

Use confidence scores and alternatives. Do not present AI outputs as absolute truth.

Human in the Loop

The AI advises; the user makes the final career decision.

Responsible AI

Risk: over-reliance on AI. Mitigation: confidence scores, alternatives, and limitations.

Why AI?

LLMs can understand project descriptions, READMEs, skills, and job requirements better than simple rules.

How Your Project Fits

Your AI Career Memory Assistant already matches most of the challenge requirements.

Features to Add

Gap Analysis, Skill Deficiencies, Confidence Score, Multiple Career Paths, Tradeoff Explanations, Recommended Next Action.

Strong Project Pitch

Analyze GitHub portfolios, compare with jobs, identify gaps, explain tradeoffs, and recommend next actions.

Big Lesson

Ask: What decision can the user make after seeing this page?
